
When diagnosing problems with insufficient performance of servers and computers, the maintainers can find help in monitoring of total load of hardware sources.

CUSTOMER MONITOR[®] automatically monitors the state of usage of CPU, RAM, HDD and network cards. This state is always archived for the past 48hours. This information can be accessed through CM portal - [Online information - state for the past 48 hours](#) [1]

If monitoring of the load for the past 48 hours is not sufficient, then use monitoring by watches - [Signalization of overload \(Watches\)](#) [2]

Date:

02/05/2012
